Abaqus can perform many types of analyses—linear or nonlinear, static or dynamic, etc. (see " Defining an analysis, " Section 6.1.2). The type of analysis can be changed from step to step. For example, in Abaqus/Standard a static preload can be analyzed first, then the response type can be changed to transient dynamic.

In Abaqus/Explicit you can also specify the limiting values of velocity in the available components as a criterion for locking. Velocity-dependent locking criteria are useful in modeling seatbelt systems in automobiles (see " Seat belt analysis of a simplified crash dummy, " Section 3.3.1 of the Abaqus Example Problems Manual). Moreover, the limiting values can be dependent on temperature and field variables.

Abaqus Car Crash Example. This is an explicit benchmark problem on Abaqus - a car crashing into a rigid wall at 25mph. The complexity, speed and dynamic nature of the impact/contact conditions is a good example of Abaqus/explicit applications. The car is modeled with a von mises material with isotropic hardening. This model has 200,000+ elements.

Several different finite element meshes were used in ABAQUS simulations of the cantilever beam problem, as shown in Figure 4-3. The simulations use either linear or quadratic, fully integrated elements and illustrate the effects of both the order of the element (first versus second) and the mesh density on the accuracy of the results.
