Under such conditions, the distance z_2 is equal to the focal length f . The equation becomes $h_2 = \frac{1}{2} \exp$

$\int_{-f}^f k u_1(u) \exp(-j u d) \cdot \frac{1}{f} \cdot$

(b) For z_1 and $d = f$, we have the object illuminated by a normally incident plane wave and situated in the front focal plane. Again $z_2 = f$.

Fourier optics is the study of classical optics using Fourier transforms, in which the waveform being considered is regarded as made up of a combination, or superposition, of plane waves. It has some parallels to the Huygens–Fresnel principle, in which the wavefront is regarded as being made up of a combination of spherical wavefronts whose sum is the wavefront being studied. A key difference is that Fourier optics considers the plane waves to be natural modes of the propagation medium, as ...
