Tanning, chemical treatment of raw animal hide or skin to convert it into leather. A tanning agent displaces water from the interstices between the protein fibres and cements these fibres together. The three most widely used tanning agents are vegetable tannin, mineral salts such as chromium sulfate, and fish or animal oil.

~~Tanning | leather manufacturing | Britannica~~

The leather manufacturing process is divided into three sub-processes: preparatory stages, tanning and crusting. All true leathers will undergo these sub-processes. A further sub-process, surface coating may be added into the sequence. The list of operations that leathers undergo vary with the type of leather.

~~Leather production processes—Wikipedia~~

Chemicals Used in Leather Processing. The following is a list of chemicals commonly used in leather making: Beamhouse and Tanyard . Biocides .
