Ripka has written the best and most comprehensive book, to date, on Magnetic field sensing. We are a manufacturer of leading edge fluxgate magnetometers and I consider this required reading for our new engineers. A "must have" for the reference library of any engineer working in the field of magnetic instrumentation.

A magnetometer is a device that measures magnetic field or magnetic dipole moment. Some magnetometers measure the direction, strength, or relative change of a magnetic field at a particular location. A compass is one such device, one that measures the direction of an ambient magnetic field, in this case, the Earth's magnetic field. Other magnetometers measure the magnetic dipole moment of a ...

The goal of the Atomic Magnetometer for Biological Imaging In Earth's Native Terrain (AMBIIENT) program is to develop novel gradient magnetic sensors that can detect sub-picotesla biological signals while operating outside of specialized facilities and in the noisy ambient field of the Earth. A successful AMBIIENT program will lead to sensors that offer a unique capability for dynamic imaging of biological processes with extensive applications in both biomedical research and clinical ...

spacecraft and satellites, mostly for scientific investigations, plus attitude sensing. Magnetometers are among the most widely used scientific instruments in exploratory and observation satellites. These instruments were instrumental in mapping the Van Allen radiation belts around Earth after its discovery by Explorer 1, and have detailed the magnetic fields of the Earth, Moon, Sun, Mars, Venus and other planets and moons. Magnetometers refer to sensors used for sensing magnetic fields OR to systems which measure magnetic field using one or more sensors. Since magnetic flux density in air is directly proportional to magnetic field strength, a magnetometer is capable of detecting fluctuations in the Earth's field.

Tri-axis Electronic Magnetometer by AKM Semiconductor, inside Motorola Xoom. A MEMS magnetic field sensor is a small-scale microelectromechanical systems (MEMS) device for detecting and measuring magnetic fields (Magnetometer). Many of these operate by detecting effects of the Lorentz force: a change in voltage or resonant frequency may be measured electronically, or a mechanical displacement may be measured optically.

Overview. Magnetometers used in geophysical survey may

use a single sensor to measure the total magnetic field

strength, or may use two (sometimes more) spatially

separated sensors to measure the gradient of the magnetic

field (the difference between the sensors). In most

archaeological applications the latter (gradiometer)

configuration is preferred because it provides better resolution

of small, near-surface phenomena.

A magnetometer works by using a passive sensing technology to detect large ferrous objects (for example, a truck, automobile, or rail car) by measuring the change in the ambient magnetic field. When a vehicle alters that magnetic field, the sensor detects those changes.

Abstract: Magnetic sensor system including an assembly comprising first, second, and third scalar point-sensor magnetometers being fixedly mounted with respect to one another such that the position of each magnetometer's axis is invariable with respect to the other magnetometers' axes. When the sensor assembly is in operation, each magnetometer ...
